ABSTRACT. The aim of this review was to describe the current state-of-the-art regarding isolation, characterization and aging of adipose tissue-derived mesenchymal stem cells (ADSCs).

Stem cell techniques and tissue engineering are the foundation of the emerging field of regenerative medicine, which requires a stable source of stem or progenitor cells.

In biology, adipose tissue, body fat, or simply fat is a loose connective tissue composed mostly of adipocytes. In addition to adipocytes, adipose tissue contains the stromal vascular fraction (SVF) of cells including preadipocytes, fibroblasts, vascular endothelial cells and a variety of immune cells such as adipose tissue macrophages.

Various source-derived mesenchymal stem cells (MSCs) have been considered for cell therapeutics in incurable diseases. To characterize MSCs from different sources, we compared human bone marrow (BM), adipose tissue (AT), and umbilical cord blood-derived MSCs (UCB-MSCs) for surface antigen expression

Adipocytes, also known as lipocytes and fat cells, are the cells that primarily compose adipose tissue, specialized in storing energy as fat. Adipocytes are derived from mesenchymal stem cells which give rise to adipocytes, osteoblasts, myocytes and other cell types through adipogenesis.

Introduction. Osteoarthritis (OA) is a condition of progressive erosion of articular cartilage characterised by worsening pain during movement of joints and decreasing ability of the joint to withstand mechanical stress, eventually limiting joint mobility and function.

On the basis on previous data, where the C-X-C chemokine receptor type 4 (CXCR4)/stromal-derived factor-1 (SDF-1) (or CXCL12) has been shown as major axis implicated in regulation of hematopoietic stem cells recruitment and retention in bone marrow stroma, it has been proposed that the same axis is involved in regulation of MSC recruitment to ...

In this review, we discuss the migration and homing ability of mesenchymal stem cells (MSCs) and MSC-like cells and factors influencing this. We also discuss studies related to the mechanism of migration and homing and the approaches undertaken to enhance it. Finally, we describe the different methods available and frequently used to track and ...

Within the STELLAR project we are investigating the use of Mesenchymal Stromal Cells (MSC) for the treatment of Kidney Disease. These MSC can be collected from the bone marrow or from adipose tissue but possibly also from the kidney.

Can stem cells help treat heart failure? With respect to the heart, stem cells have the ability to not only home into the damaged areas but also to initiate a cascade of biological events which both culminate in healing of the heart muscle.

Can stem cells help treat multiple sclerosis? At present there are no treatments that specifically target the abnormal immune responses in MS. Current approaches, such as interferon, copaxone, or immune suppressants all act in a non-specific manner blocking immune responses against the myelin sheath.
